Abstract:

Fisheries induced evolution (FIE) is hypothesized to cause changes in the life history, physiology and behavior of exploited fish stocks. Most studies evaluating FIE have occurred in exploited marine stocks which offer little opportunity for replication and few unexploited stocks exist for comparison. Inland recreational fisheries, however, offer the opportunity to replicate experiments in multiple systems, and while rare, unexploited populations exist for comparison. We measured the resting metabolic rate of four populations of largemouth bass, two exploited and two unexploited, to evaluate whether patterns of resting metabolic rates conformed to expectations for fisheries induced evolution. This document contains the resting metabolic rate data collected in the field from September 16th 2013 through October 22nd 2013. These data form the basis for an open access publication and are archived here as supplemental information.

Keywords: Fisheries Induced Evolution, recreational fisheries, largemouth bass

The following table contains resting metabolic rate (RMR) data collected by Jan-Michael Hessenauer from September 16th 2013 through October 22nd 2013.

Fish from four populations, two exploited by anglers (Amos Lake and Gardner Lake) and two unexploited by anglers (Hemlock Reservoir and Easton Reservoir) were held in a common environment for 10 months prior to data collection. Data were collected using an intermittent flow-through respirometer, comprised of four ~0.75 L total volume chambers. Variation in oxygen partial pressure was measured using an OXY-4 fiber optic oxygen probe (Loloigo Systems, Tjele, Denmark), and metabolic rate was calculated based on the equation:

$$M_{O_2} = \frac{k \times V \times \alpha}{m}$$

Where M_{O_2} is oxygen consumption (metabolic rate) expressed in $\text{mg O}_2 \cdot \text{kg}^{-1} \cdot \text{h}^{-1}$, k is the slope of the regression line between Oxygen partial pressure in each tube over run time, V is the volume of the respirometry chamber, α is the solubility of oxygen in water at the experimental temperature and m is the mass of the fish in kg.

FishID represents the identification number of each individual, Temp is the temperature in degrees Celsius at which the measurement was made, Pop is the population of origin of each individual, Met is the metabolic rate measured, R2 is the R^2 value of each measurement. Weight is the weight of each fish in grams. Length is the length of each fish in mm. Fished represents the exploitation status of the source population, with yes representing an exploited population and no representing an unexploited population. Tube represents which of the four respirometry chambers the fish was measured in and Date is the date that data was collected.

FishID	Temp	Pop	Met	R2	Weight	Length	Fished	Tube	Date
