## I. SYNOPSIS

The idea that quantum mechanics “becomes” classical mechanics in the limit  $\hbar \rightarrow 0$  (and in the limit  $c \rightarrow \infty$ , but that's not treated here) is discussed using Ehrenfest's theorem.

## II. THE MOMENTUM OPERATOR $p_{op}^x = -i\hbar \frac{\partial}{\partial x}$

How is it possible that a wave function can in some way imitate Newton's Second Law?

We start with a definition of momentum.

Assuming the Schrödinger Equation:

$$H\psi = i\hbar \frac{\partial \psi}{\partial t}$$

and

$$H\psi^* = -i\hbar \frac{\partial \psi^*}{\partial t}$$

where  $H$ , the Hamiltonian, has the form (for a one-dimensional particle subject to a potential function  $V(x)$ ),

$$-\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} + V(x)$$

i.e., we are dealing with a conservative one dimensional system, then

$$\frac{d \langle x \rangle}{dt} = \int \frac{d\psi^*}{dt} x \psi dx + \int \psi^* x \frac{d\psi}{dt} dx$$

which becomes

$$\frac{d \langle x \rangle}{dt} = \int -\frac{1}{i\hbar} H\psi^* x \psi dx + \int \psi^* x \frac{1}{i\hbar} H\psi dx$$

$$\begin{aligned} \frac{d \langle x \rangle}{dt} = \int -\frac{1}{i\hbar} \left\{ \left( -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} + V(x) \right) \psi^* \right\} x \psi dx + \\ \int \psi^* x \frac{1}{i\hbar} \left\{ \left( -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} + V(x) \right) \psi \right\} dx \end{aligned}$$

The integrals containing  $V$  cancel using the Hermitian property of  $V$  over  $\psi$ . We are left with

$$\begin{aligned} \frac{d \langle x \rangle}{dt} = \int -\frac{1}{i\hbar} \left\{ \left( -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} \right) \psi^* \right\} x \psi dx + \\ \int \psi^* x \frac{1}{i\hbar} \left\{ \left( -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} \right) \psi \right\} dx \end{aligned}$$

which is

$$\begin{aligned} i\hbar \frac{2m}{\hbar^2} \frac{d \langle x \rangle}{dt} = \int \left\{ \left( \frac{\partial^2 \psi^*}{\partial x^2} \right) x \psi \right\} dx - \\ \int \left\{ \psi^* x \left( \frac{\partial^2 \psi}{\partial x^2} \right) \right\} dx \end{aligned}$$

each of which can be integrated twice by parts, yielding for the first term

$$\begin{aligned} i\hbar \frac{2m}{\hbar^2} \frac{d \langle x \rangle}{dt} = \int \left\{ \left( \frac{\partial \frac{\partial \psi^*}{\partial x}}{\partial x} \right) x \psi \right\} dx - \\ \int \left\{ \psi^* x \left( \frac{\partial^2 \psi}{\partial x^2} \right) \right\} dx \end{aligned}$$

where we define  $u$  as  $x\psi$  and  $dv$  as

$$dv = \frac{\partial \frac{\partial \psi^*}{\partial x}}{\partial x} dx = d \left( \frac{\partial \psi^*}{\partial x} \right)$$

so that  $v = \frac{\partial \psi^*}{\partial x}$ .

We integrate by parts, obtaining

$$= \frac{\partial \psi^*}{\partial x} x \psi \Big|_{-\infty}^{\infty} - \int_{-\infty}^{\infty} \frac{\partial \psi^*}{\partial x} \frac{\partial(x\psi)}{\partial x} dx - \int_{-\infty}^{\infty} \left\{ \psi^* x \left( \frac{\partial^2 \psi}{\partial x^2} \right) \right\} dx$$

but the non integral parts of the above vanish, since the wave functions are required to have zero slope at plus and minus infinity.

$$= - \int_{-\infty}^{\infty} \frac{\partial \psi^*}{\partial x} \frac{\partial(x\psi)}{\partial x} dx - \int_{-\infty}^{\infty} \left\{ \psi^* x \left( \frac{\partial^2 \psi}{\partial x^2} \right) \right\} dx$$

We integrate again by parts, with  $\frac{\partial \psi^*}{\partial x} dx$  as  $dv$ , and  $\frac{\partial(x\psi)}{\partial x}$  as  $u$ , and obtain

$$- \psi^* \frac{\partial(x\psi)}{\partial x} \Big|_{-\infty}^{\infty} + \int_{-\infty}^{\infty} \psi^* \frac{\partial^2(x\psi)}{\partial x^2} dx$$

so, again declaring the first term to be zero, we have

$$i\hbar \frac{2m}{\hbar^2} \frac{d \langle x \rangle}{dt} = + \int_{-\infty}^{\infty} \psi^* \frac{\partial^2(x\psi)}{\partial x^2} dx - \int_{-\infty}^{\infty} \psi^* x \frac{\partial^2(\psi)}{\partial x^2} dx$$

which is

$$i\hbar \frac{2m}{\hbar^2} \frac{d \langle x \rangle}{dt} = \int_{-\infty}^{\infty} \frac{\partial \left( \frac{\partial(x\psi)}{\partial x} - x \frac{\partial \psi}{\partial x} + \frac{\partial \psi}{\partial x} \right)}{\partial x} dx$$

or

$$i\hbar \frac{2m}{\hbar^2} \frac{d\langle x \rangle}{dt} = \int_{-\infty}^{\infty} \frac{\partial \left( \frac{\partial(\psi)}{\partial x} + x \frac{\partial \psi}{\partial x} - x \frac{\partial \psi}{\partial x} + \frac{\partial \psi}{\partial x} \right)}{\partial x} dx$$

which becomes

$$i \frac{2m}{\hbar} \frac{d\langle x \rangle}{dt} = \int_{-\infty}^{\infty} \frac{\partial \left( 2 \frac{\partial(\psi)}{\partial x} \right)}{\partial x} dx = 2 \int_{-\infty}^{\infty} \psi^* \frac{\partial \psi}{\partial x} dx$$

which is

$$m \frac{d\langle x \rangle}{dt} = \frac{\hbar}{i} \int_{-\infty}^{\infty} \psi^* \frac{\partial \psi}{\partial x} dx$$

$$m \frac{d\langle x \rangle}{dt} = \int_{-\infty}^{\infty} \psi^* \left( \frac{\hbar}{i} \frac{\partial}{\partial x} \right) \psi dx$$

or

$$m \frac{d\langle x \rangle}{dt} = \int_{-\infty}^{\infty} \psi^* \left( -i \hbar \frac{\partial}{\partial x} \right) \psi dx$$

or, once again:

$$m \frac{d\langle x \rangle}{dt} = \int_{-\infty}^{\infty} \psi^* p_{op}^x \psi dx$$

which identifies the operator which we normally associate with the linear momentum. So, Ehrenfest's first theorem recovers the operator definition of the linear momentum.

### III. NEWTON'S SECOND LAW RECOVERED

Now we repeat the above computation, but instead look at the time rate of change of momentum, looking to recover Newton's 2'nd Law. We have

$$\frac{d\langle p \rangle}{dt} = -i\hbar \frac{d}{dt} \int \psi^* \frac{\partial \psi}{\partial x} dx$$

which we are also going to integrate (by parts).

We have

$$-\frac{1}{i\hbar} \frac{d\langle p \rangle}{dt} = \int \frac{\partial \psi^*}{\partial t} \frac{\partial \psi}{\partial x} dx + \int \psi^* \frac{d}{dt} \frac{\partial \psi}{\partial x} dx$$

which is

$$\begin{aligned} -\frac{1}{i\hbar} \frac{d\langle p \rangle}{dt} &= \int \frac{\partial \psi^*}{\partial t} \frac{\partial \psi}{\partial x} dx + \int \psi^* \frac{d}{dt} \frac{\partial \psi}{\partial x} dx \\ &= \int \frac{\partial \psi^*}{\partial t} \frac{\partial \psi}{\partial x} dx + \frac{1}{i\hbar} \int \psi^* \frac{dH\psi}{dx} dx \end{aligned}$$

or

$$\begin{aligned} -\frac{1}{i\hbar} \frac{d\langle p \rangle}{dt} &= \int \frac{\partial \psi^*}{\partial t} \frac{\partial \psi}{\partial x} dx \\ &+ \frac{1}{i\hbar} \int \psi^* \frac{d \left( \frac{-\hbar^2}{2\mu} \frac{\partial^2 \psi}{\partial x^2} + V(x) \right) \psi}{dx} dx \\ -\frac{1}{i\hbar} \frac{d\langle p \rangle}{dt} &= \int \left( \frac{dx}{-i\hbar} \left( -\frac{\hbar^2}{2\mu} \frac{\partial^2 \psi^*}{\partial x^2} \right. \right. \\ &\quad \left. \left. + V\psi^* \right) \frac{\partial \psi}{\partial x} dx \right. \\ &\quad \left. + \frac{1}{i\hbar} \int \psi^* \frac{d \left( \frac{-\hbar^2}{2\mu} \frac{\partial^2 \psi}{\partial x^2} + V(x) \right) \psi}{dx} dx \right) \end{aligned}$$

and again, when integrating by parts, the two terms related to the kinetic energy operator cancel. We are left with

$$-\frac{d\langle p \rangle}{dt} = \left( - \int V \psi^* \frac{\partial \psi}{\partial x} dx + \int \psi^* \left( \frac{dV(x)\psi}{dx} \right) dx \right)$$

$$\begin{aligned} \frac{d\langle p \rangle}{dt} &= - \left( - \int (V\psi^*) \frac{\partial \psi}{\partial x} dx + \right. \\ &\quad \left. \int \left( \psi^* \left( \frac{dV(x)}{dx} \psi + V(x) \frac{d\psi}{dx} \right) dx \right) \right) \end{aligned}$$

which is

$$\frac{d\langle p \rangle}{dt} = + \int \left( \psi^* \left( \frac{dV(x)}{dx} \psi \right) \right) dx$$

Clearly, we have obtained something akin to Newton's second law.
